

STRUCTURAL PROJECT

Albanian Jewish Museum

AUGUST 2024

PILE PLUMBING PLAN QUOTE -1.00/PLANI I PERGJITHSHEM I TPIKETIMIT TE PILOTAVE, KUOTA -1.00:

SH: 1:100

Shenime Teknike:
1-Pilotat do te jene te kafshuara, per kete arsye duhet te ndertohet detyrimisht tra udhezues per piketimin dhe realizimin e tyre. Trau te ndertohet sipas detajit te shqyrtuar ne vijim.
2-Klasa e betonit per pilotat, dhe traun e pilotave te jete C25/30 dhe me additive per vetngjeshje dhe per pershpelimin e kohes se arrijtes se klases se kerkuar te betonit. Heluri duhet te jete i klases S-500 me rezistence ne kullrim e rrjedshmerise $f_{ct} = 500\text{MPa}$.
3-Pilotat te betonohen me pajeter me tub, ne menyre qe betoni te mos fraksionohet gjate hedhjes e lartesi.
4-Pilotat duhet te kene me pajeter distancatore per krijimin e shtreses mbrojtese te betonit.
5-Para betonimit te traut duhet me pajeter te shikohen fletet ne te cilat jepen detajet e montimit te tubave te pajantimit, dhe te lihen prizonierat e nevojshem per kete.
6-Para se te montohen tubat e pajantimit te pilotave, mund te germohej 2m thellesi nga niveli i poshtem i traut te pilotave.
Kujdes: Kjo thellesi nuk duhet te tejkalohet per asnje arsye. Ne gofte se zbatuesi i punimeve nuk ka veshitresi ne kryerjen e procesit te gerrimit tubat mund te vendosen para se te filloje gerrimi.
7-Tubat e pajantimit mund te hiqen vetem pasi te jete betonuar pllaka e themellit, dhe hapesia mes pllakes dhe pilotave te mbushet me beton te klases C16/20.
8-Betonimi i hapesires mes pllakes dhe pilotave te behet vetem pasi te jete bere hidroizolimi i pllakes se themellit.

Shenime Teknike: Ne zonen ku takohen pilotat me themelin ekzistues te tregohet kujdes qe pilotat te jene sa me afer te jete e mundur me murin ekzistues, por pa e demtuar ate.
Technical note: On the are where the piles are near to the existing building, special attention should be in order to put them as near as it is possible, but not to damage the existing wall.

Technical Notes:
1-Piles will be secant, for this reason should be built a guide beam for plumbing and realizing them. The beam should be built according to the details reviewed below.
2-The class of concrete for piles, and the crown beam of piles will be C25/30 with additives for self-compaction and to speed up the time in which concrete reaches the strength. Steel class will be S-500 with the yield strength of $f_y = 500\text{MPa}$.
3-The piles must be poured with a pipe, so that the concrete does not fractionate during high casting.
4-The piles must have spacers for addressing the concrete protective layer.
5-Before pouring the beam, sheets that give the details of the installation of the pipes should be consulted, in order to have the correct precaution to install bolts and anchors.
6-Before installing the steel pipes that suport the piles, 2m depth can be diged from the bottom level of the crown beam.
Caution: This depth shouldnt be more than 2m for any reason. If the contractor of the work has no difficulty in carrying out the digging process, the pipes can be placed before the drilling begins.
7-The steel pipes can be removed only after the mat foundation has been poured, and the space between the slab and the piles is filled with concrete of C16/20 class.
8-The pouring of the space between the mat foundation and the piles should be done only after the waterproofing of the foundation slab has been done.

TECHNICAL NOTES:

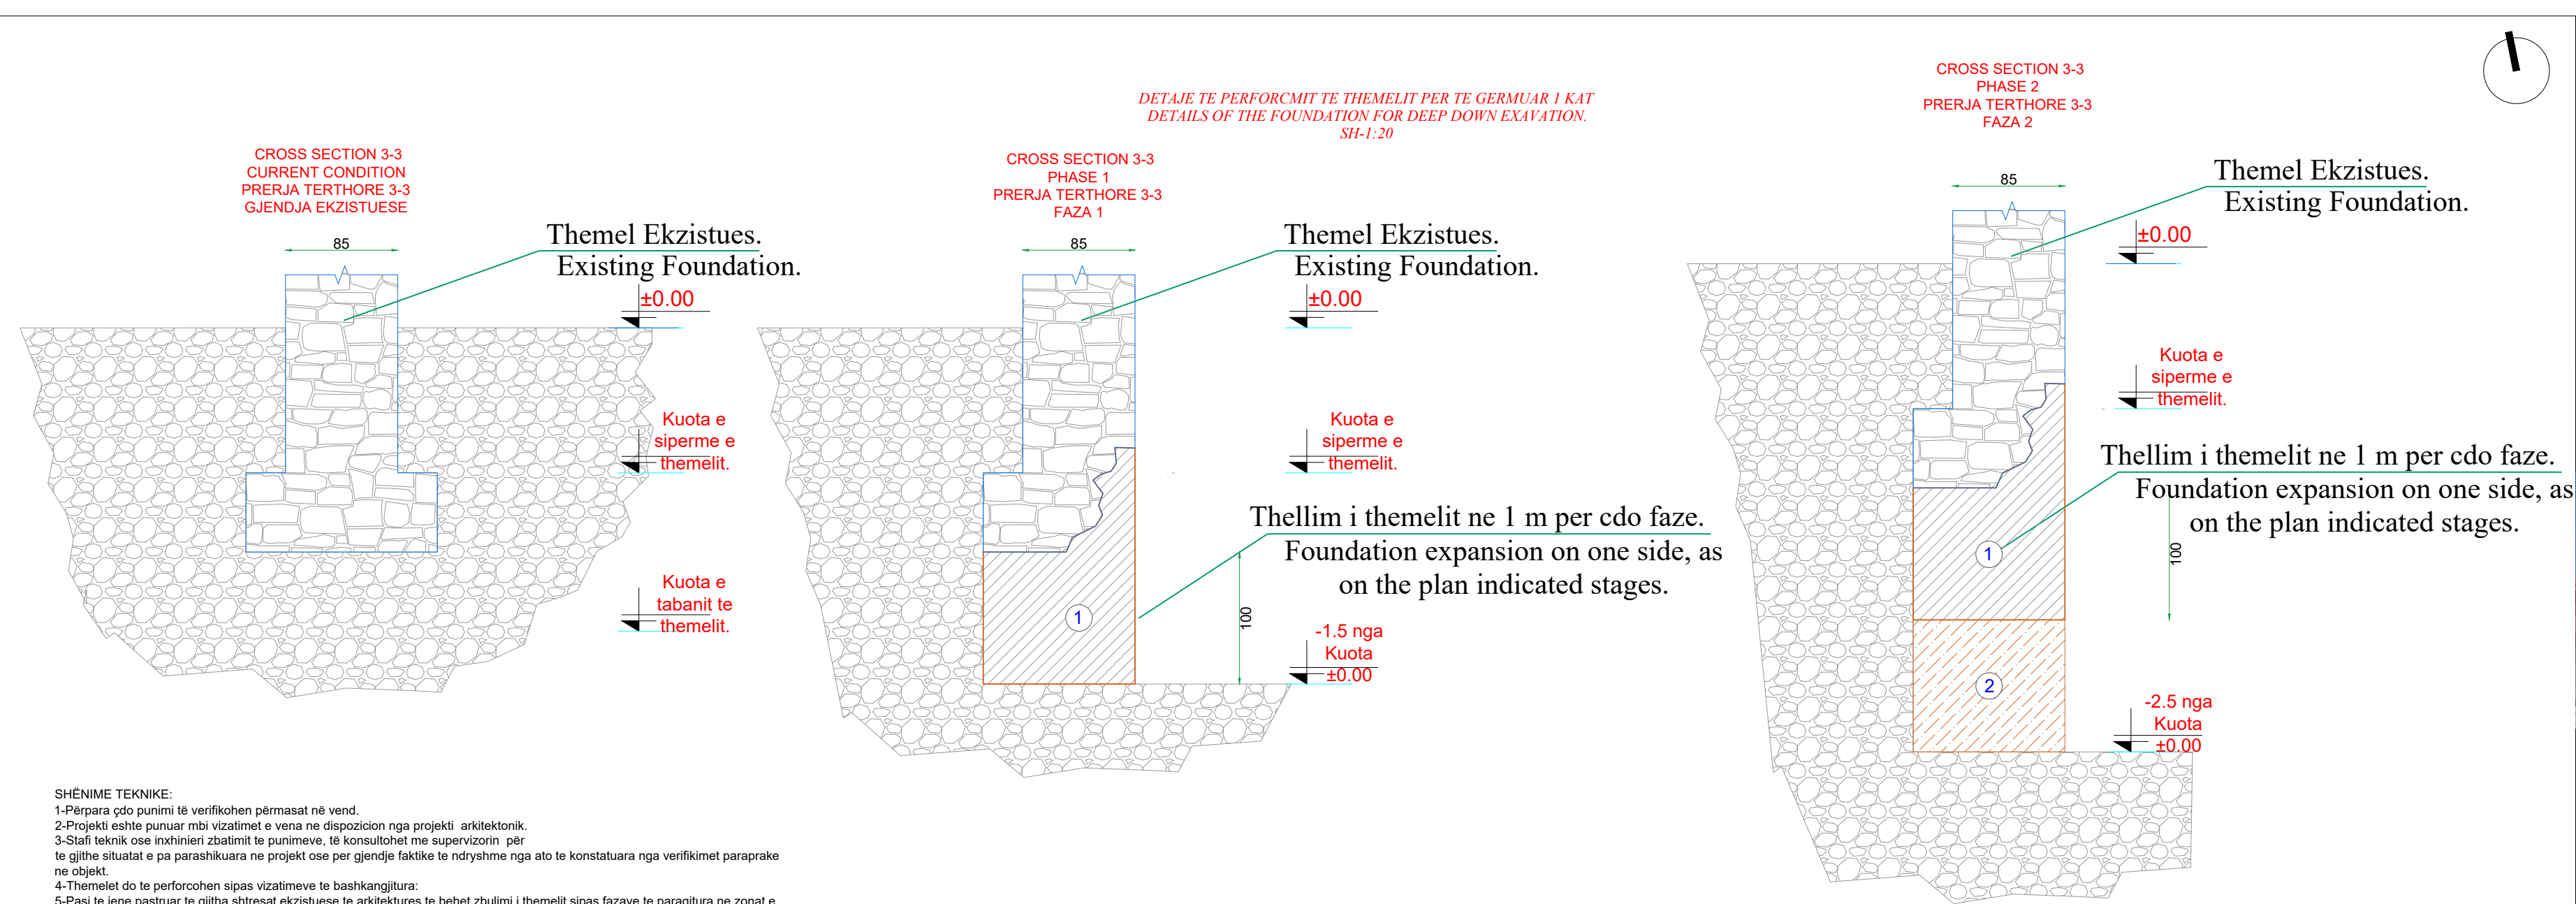

- 1-Before any work, verify the dimensions on site.
- 2-The project was worked on the drawings available from the architectural project.
- 3-The technical staff or the site engineer of works, to consult with the supervisor for all situations not foreseen in the project or for actual conditions different from those established by the preliminary verifications in the structure.
- 4-The foundations will be reinforced according to the attached drawings.
- 5- After all the existing layers of the architecture have been removed, to reveal the foundation according to the phases shown in the colored areas of the plan, just as they are foreseen in the architectural project.
- 6-Each opening will be 1m long, in cases where there are curves or obstacles from the walls, it can be made even smaller.
- 7-Before installing the reinforcement, the foundation must be cleaned of mud and all possible impurities.
- 8- If damaged stones or areas without a foundation are encountered in the foundation, it must be repaired with the same detail, only by filling in the missing areas with concrete. In all areas where we have different levels of the foundation, the repair of the foundation must be on the same quote.
- 9-The concrete must be of class C30/37, while the steel plates S-500.
- 10-Longitudinal bars in the area off joints and angles must be connected to each other as shown in the attached details. For the case where we only have one side of the foundation reinforcement, only one side of the detail is applied.
- 11-The area on which will be the under ground area will be the last that will be retrofitted. So the work on this area will start once all other foundation retrofitting it is finished, on this case all the rebar's will be continuous all over the length.
- 12- The digging of the new foundation will be done 1 m for each phase. If it is found strong presence of the underground waters, the digging should be done for the depth of 0.5 for every phase. Care must be taken that the organization of the phases in the plan is phased from the first phase, and so all the phases in turn. After every 1m is opened, then its concreting will be done. All phases must be coordinated with the setting of the agreements according to the attached detail.
- 13-In the last phase of concreting the wall, care must be taken to alternate the cross-section bars with the reinforcement of the foundation plate.
- 14-In case of difficulty, the stages can be made smaller than 1m deep, but never more than that.

- 13- In the last phase of concreting the wall, care must be taken to alternate the cross-section bars with the reinforcement of the foundation plate.
- 14- In case of difficulty, the stages can be made smaller than 1m deep, but never more than that.

SHËNIME TEKNIKE:

- Përpara çdo punimi të verifikohen përmasat në vend.
- Projekti është punuar mbi vizatimet e vena në dispozicion nga projekti arkitektonik.
- Stafi teknik ose inxhinieri zbatimit të punimeve, të konsultohet me supervisorin për të gjithë situatat e pa parashikuara në projekt ose per gjendje faktike të ndryshme nga ato të konstatuara nga verifikimet paraprake në objekt.
- Themelet do të perforcohen sipas vizatimeve të bashkangjitura.
- Pasi të jene pastruar të gjitha shtresat ekzistuese të arkitektures të behet zbulimi i themelit sipas fazave të paraqitura në zonat e ngjyrosura të planit.
- Cdo hapje do të jete me gjatesi 1m, në rastet kur kemi kthesa ose pengesa nga muret mund të behet edhe me e vogel.Hapja do të behet nje here per cdo ane, pra asnjehere nuk do të perforcohen dy ane të murit njëkohesisht.
- Pra vendosjes së armatures themli duhet të pastrohet nga balla dhe nga të gjitha papasteritite e mundshme.
- Në rast se në themel ndeshen gure të demtuar ose zona pa themel ai duhet të riparohet me të njëjtin detaj , vetem se duke plotesuar me beton zonat ku ka mungese. Në të gjitha zonat ku kemi disnivel riparimi i themelit duhet të behet në të njëjten kuota.
- Betoni duhet të jete i klases C25 /30 me additive lubrifikues dhe vetengjeses ndersa celiku i klases S-500.
- Shufrat gjatesore në zonen e nyjeve dhe të kthesave duhet të lidhen me njera tjetren sikurse paraqitet në detajet e bashkangjitura. Per rastin kur e kemi vetem nga nje ane perforcimin e themelit, aplikohet vetem njera ane e detajit.
- Pra betonimit të cdo faze të themelit të shikohen fletet e armimit të cdo themeli , në menyre që të lihen fitilat per tu lidhur me armaturen e murit dhe themelit të ri .
- Thellimi i themelit do të behet per 1 m thellesi në cdo faze. Asnjehere gërmimi nuk duhet të kalojë thellesinë 1 m. Në gqofte se ndeshet prezence e larte e ujerave nentokesore, fazat të behen cdo 0.5m. Duhet të tregohet kujdes që organizimi i fazave në plan të behet i shtazur nga faza e pare, e keshtu me rradhe të gjitha fazat.
- Pasi të jete hapur cdo 1m atehere do të behet betonimi i tij. Të gjitha fazat duhet të koordinohen me vendosjen e ankerave ose masave të tjera perforcuese.
- Në fazen e fundit të betonimit të murit duhet që të tregohet kujdes që stafat e prerjes tertshore të alternohen me armimin e pllakes së themelit.
- Në rast se do të ndeshet veshitresi fazat mund të behen me të vogla se 1m thellesi, por asnjehere me shume se kaq.

TECHNICAL NOTES:

- Before any work, verify the dimensions on site.
- The project was worked on the drawings available from the architectural project.
- The technical staff or the site engineer of works, to consult with the supervisor for all situations not foreseen in the project or for actual conditions different from those established by the preliminary verifications in the structure.
- The foundations will be reinforced according to the attached drawings:
- After all the existing layers of the architecture have been removed, to reveal the foundation according to the phases shown in the colored areas of the plan, just as they are foreseen in the architectural project.
- Each opening will be 1m long, in cases where there are curves or obstacles from the walls, it can be made even smaller.
- Before installing the reinforcement, the foundation must be cleaned of mud and all possible impurities.
- If damaged stones or areas without a foundation are encountered in the foundation, it must be repaired with the same detail, only by filling in the missing areas with concrete. In all areas where we have different levels of the foundation, the repair of the foundation must be on the same quote.

- 12-Thellimi i themelit do te behet per 1 m thellesi ne cdo faze. Asnjehere gerrimi nuk duhet te kaloje thellesine 1 m. Ne gqofte se ndeshet prezence e larte e ujerave nentokesorre, fazat te behen cdo 0.5m. Duhet te tregohet kujdes qe organizimi i fazave ne plan te behet i sfazuar nga faza e pare, e keshtu me radhe te gjitha fazat.
- Pasi te jete hapur cdo 1m atehere do te behet betonimi i tij . Te gjitha fazat duhet te koordinohen me vendosjen e ankerave ose masave te tjera perforcuese.
- 13-Ne fazen e fundit te betonimit te murit duhet qe te tregohet kujdes qe stafat e prerjes terthore te alternohen me armimin e pllakeve se themelit.
- 14-Ne rast se do te ndeshet veshitlresi fazat mund te behen me te vogla se 1m thellesi, por asnjehere me shume se kaq.

TECHNICAL NOTES:

- 1- Before any work, verify the dimensions on site.
- 2-The project was worked on the drawings available from the architectural project.
- 3-The technical staff or the site engineer of works, to consult with the supervisor for all situations not foreseen in the project or for actual conditions different from those established by the preliminary verifications in the structure.
- 4-The foundations will be reinforced according to the attached drawings:
- 5- After all the existing layers of the architecture have been removed, to reveal the foundation according to the phases shown in the colored areas of the plan, just as they are foreseen in the architectural project.
- 6-Each opening will be 1m long, in cases where there are curves or obstacles from the walls, it can be made even smaller.
- 7-Before installing the reinforcement, the foundation must be cleaned of mud and all possible impurities.
- 8- If damaged stones or areas without a foundation are encountered in the foundation, it must be repaired with the same detail, only by filling in the missing areas with concrete. In all areas where we have different levels of the foundation, the repair of the foundation must be on the same quote.
- 9-The concrete must be of class C30/37, while the steel of class S-500.
- 10-Longitudinal bars in the area off joints and angles must be connected to each other as shown in the attached details. For the case where we only have one side of the foundation reinforcement, only one side of the detail is applied.
- 11-The are on witch will be the under ground area will be the last that will be retrofitted. So the work on this area will start once all other foundation retrofitting it is finished, on this case all the rebar's will be continuous all over the length.
- 12- The digging of the new foundation will be done 1 m for each phase. If it is found strong presence of the underground waters, the digging should be done for the depth of 0.5 for every phase. Care must be taken that the organization of the phases in the plan is phased from the first phase, and so all the phases in turn. After every 1m is opened, then its concreting will be done. All phases must be coordinated with the setting of the agreements according to the attached detail.
- 13-In the last phase of concreting the wall, care must be taken to alternate the cross-section bars with the reinforcement of the foundation plate.
- 14-In case of difficulty, the stages can be made smaller than 1m deep, but never more than that.

LEGEND / LEGJENDA		
	First phase on the foundation restoration / Fazë e parë e ndërtimit në themel.	Stone walls / Mure Guri
	Second phase on the foundation restoration / Fazë e dytë e ndërtimit në themel.	Steel plate to fix the anchors and rebars/ Pëllatë çeliku për të fiksuar shufrat dhe prizonierat
	Third phase on the foundation restoration / Fazë e tretë e ndërtimit në themel.	Self anchorage bolt to fix the facade walls / Bullon me mekanizëm vetështrëngues për shtrëngimin e elementeve të fasadës.
	Fourth and last phase/ Fazë e katërt dhe e fundit.	Steel rebars 12 mmwathing / Shufrat gjatësore me diametër 12 mm korton.
	Bolts that are used to join steel or wood profiles / Bullona për bashkimin e profileve të çelikut ose drurit.	Holes for the special grout filling. / Vrima të hapura për të cementuar murin me lënc special.
	New wood beams / Trave të ri druri.	Facade specially shaped stones / Guri të punuar të fasadës.
	New steel wathing anchors 12 mm / Prizoniera të reja me diametër 12 mm korton.	
	Expansive grout to fill the joints / Lënc special për mbushjen e fagave dhe nivelim.	

SHËNIME TEKNIKE:

- Përpara çdo punimi të verifikohen përmasat në vend.
- Projekti është punuar mbi vizatimet e vena në dispozicion nga projekti arkitektonik.
- Stafi teknik ose inxhinieri zbatimit të punimeve, të konsultohet me supervizorin për të gjithë situatat e pa parashikuara në projekt ose për gjendje faktike të ndryshme nga ato të konstatuara nga verifikimet paraprake në objekt.
- Themelet do të perforcohen sipas vizatimeve të bashkangjitura:
- Pasi të jenë pastruar të gjitha shtresat ekzistuese të arkitektures të behet zbulimi i themelit sipas fazave të paraqitura në zonat e ngjyrosura të planit.
- Cdo hapje do të jetë me gjatësi 1m, në rastet kur kemi kthesa ose pengesa nga muret mund të behet edhe me e vogël.Hapja do të behet një here për cdo anë, pra asnjehere nuk do të perforcohen dy ane të murit njëkohesisht.
- Për vendosjen e armatës themli duhet të pastrohet nga balta dhe nga të gjitha papastërtitë e mundshme.
- Në rast se në themel ndeshen gure të demtuar ose zona pa themel,ai duhet të riparohet me të njëjtin detaj , vetëm se duke plotësuar me beton zonat ku ka mungesë. Në të gjitha zonat ku kemi disnivele riparimi i themelit duhet të behet në të njëjten kuotë.
- Betoni duhet të jetë i klases C25 /30 me aditive lubrifikues dhe vetëngjeshës ndërsa çeliku i klases S-500.
- Shufrat gjatësore në zonën e nyjeve dhe të kthesave duhet të lidhen me njëra tjetren sikurse paraqitet në detajet e bashkangjitura. Për rastin kur e kemi vetëm nga një anë perforcimin e themelit, aplikohet vetëm njëra anë e detajit.
- Për betonimin të cdo faze të themelit të shikohen fletet e armimit të cdo themeli , në mënyrë që të lihen fillat për tu lidhur me armaturen e murit dhe themelit të ri .
- Thellimi i themelit do të behet për 1 m thellesi në cdo fazë. Asnjehere gërmimi nuk duhet të kalojë thellesinë 1 m. Në qoftë se ndeshet prezence e lartë e ujërave nentokësore, fazat të behen cdo 0.5m. Duhet të tregohet kujdes që organizimi i fazave në plan të behet i sfizuar nga faza e parë, e keshtu me radhë të gjitha fazat.
- Pasi të jete hapur cdo 1m atehere do të behet betonimi i tij. Të gjitha fazat duhet të koordinohen me vendosjen e ankerave ose masave të tjera perforcuese.
- Në fazën e fundit të betonimit të murit duhet që të tregohet kujdes që stafat e prerjes terthore të alternohen me armimin e pllakes së themelit.
- Në rast se do të ndeshet veshitësi fazat mund të behen me të vogla se 1m thellesi, por asnjehere me shumë se kaç.

TECHNICAL NOTES:

- Before any work, verify the dimensions on site.
- The project was worked on the drawings available from the architectural project.
- The technical staff or the site engineer of works, to consult with the supervisor for all situations not foreseen in the project or for actual conditions different from those established by the preliminary verifications in the structure.
- The foundations will be reinforced according to the attached drawings:
- After all the existing layers of the architecture have been removed, to reveal the foundation according to the phases shown in the colored areas of the plan, just as they are foreseen in the architectural project.
- Each opening will be 1m long, in cases where there are curves or obstacles from the walls, it can be made even smaller.
- Before installing the reinforcement, the foundation must be cleaned of mud and all possible impurities.
- If damaged stones or areas without a foundation are encountered in the foundation, it must be repaired with the same detail, only by filling in the missing areas with concrete. In all areas where we have different levels of the foundation, the repair of the foundation must be on the same quote.
- The concrete must be of class C30/37, while the steel of class S-500.
- Longitudinal bars in the area off joints and angles must be connected to each other as shown in the attached details. For the case where we only have one side of the foundation reinforcement, only one side of the detail is applied.
- The are on witch will be the under ground area will be the last that will be retrofitted. So the work on this area will start once all other foundation retrofitting it is finished, on this case all the rebar's will be continuous all over the length.
- The digging of the new foundation will be done 1 m for each phase. If it is found strong presence of the underground waters, the digging should be done for the depth of 0.5 for every phase. Care must be taken that the organization of the phases in the plan is phased from the first phase, and so all the phases in turn. After every 1m is opened, then its concreting will be done. All phases must be coordinated with the setting of the agreements according to the attached detail.
- In the last phase of concreting the wall, care must be taken to alternate the cross-section bars with the reinforcement of the foundation plate.
- In case of difficulty, the stages can be made smaller than 1m deep, but never more than that.
